

Foodlogik Van Loading

On-Line update of Van Orders and Stock

FoodLogik's Van Loading module is a cost-effective way of recording stock as it's loaded into the vans at the start of the day, using low-cost retail scanners and standard Windows laptops. Bar-coded labels can be printed from Foodlogik as part of the production paperwork, or the product EAN code can be used for purchased goods such as cola and crisps. When products are scanned the van order and the stock database are instantly updated, so you know what's been loaded onto the van and what's still available in the warehouse.

Van Loading in use scanning a Foodlogik product label with a retail scanner.

Van Loading updates the order delivery quantities and warehouse stock balances. On returning to base, stock is scanned using the *Unload* screen off the van back into the warehouse as a return or into a cage as retained stock. The program also records any waste and updates the warehouse stock again. This swift procedure enables stock and sales to be reconciled every day as soon as recording is complete—not at the end of the week when its too late to take action!

Foodlogik automatically prints bar-coded labels

So using completely off the shelf technology and standard Foodlogik software our customers are able to keep a track of their costs and revenues while also greatly improving admin efficiency.
